

# BOOKRATINGS

I need a mobile web app for our company: BooksRatings! Here's the concept: give your opinion on a book and consult the opinions of other readers before embarking on reading a book.

## The app will feature 2 functionalities:

- The first will be: create a city-specific best-seller trend geolocated system
- The second will be an access to the database to consult book reviews (MySQL).

## Features to be developed:

- Rating system with stars.
- Text area to write comments for each product.

## Interface to be developed:

- An interface to scan the book.
- A login page (with username and password).
- An interface showing the different reviews.
- Geolocation interface (where you are) to create the bestseller for each city entered.
- A customer account interface

All we need is the code (html, css and a bit of javascript) and a Word file explaining the code, so we understand what you've done. For color, we're using purple(#D473D4) and white for the background and I'll send you our logo later today.

If you have any questions, please don't hesitate! Thanks in advance for your work 😊
